

Here are the steps I've done when I started creating the page for the typography 2.

**Note:** I went through these videos for my crash course, specifically for the CSS portion

<https://www.youtube.com/watch?v=D-h8L5hgW-w>

<https://www.youtube.com/watch?v=jV8B24rSN5o>

1. Installed Visual Studio Code for my text editor
2. Added the following plug-ins to view changes live
  - a. Live Sass Compiler
  - b. Live Server
3. Started working on the HTML section first of the page to enter the text following some of the instructions on the tutorials above.
4. After HTML, proceed with coding CSS.
5. After coding and testing the designs, I've also uploaded my codes in github to test whether there will be changes on the fonts I've used.

**Here's some information regarding the design changes.**

- **Changes on the Grid** - I realized that I've placed too much grid which may not be necessary so excluding the margins, I reduced it to 3 columns and 6 rows.
- **Body** - the space space between the word HIV and AIDS are a bit wider on the web design. The phrase "Stop the Spread of" seems to be a little more bolder.
